

AddSecure AddView

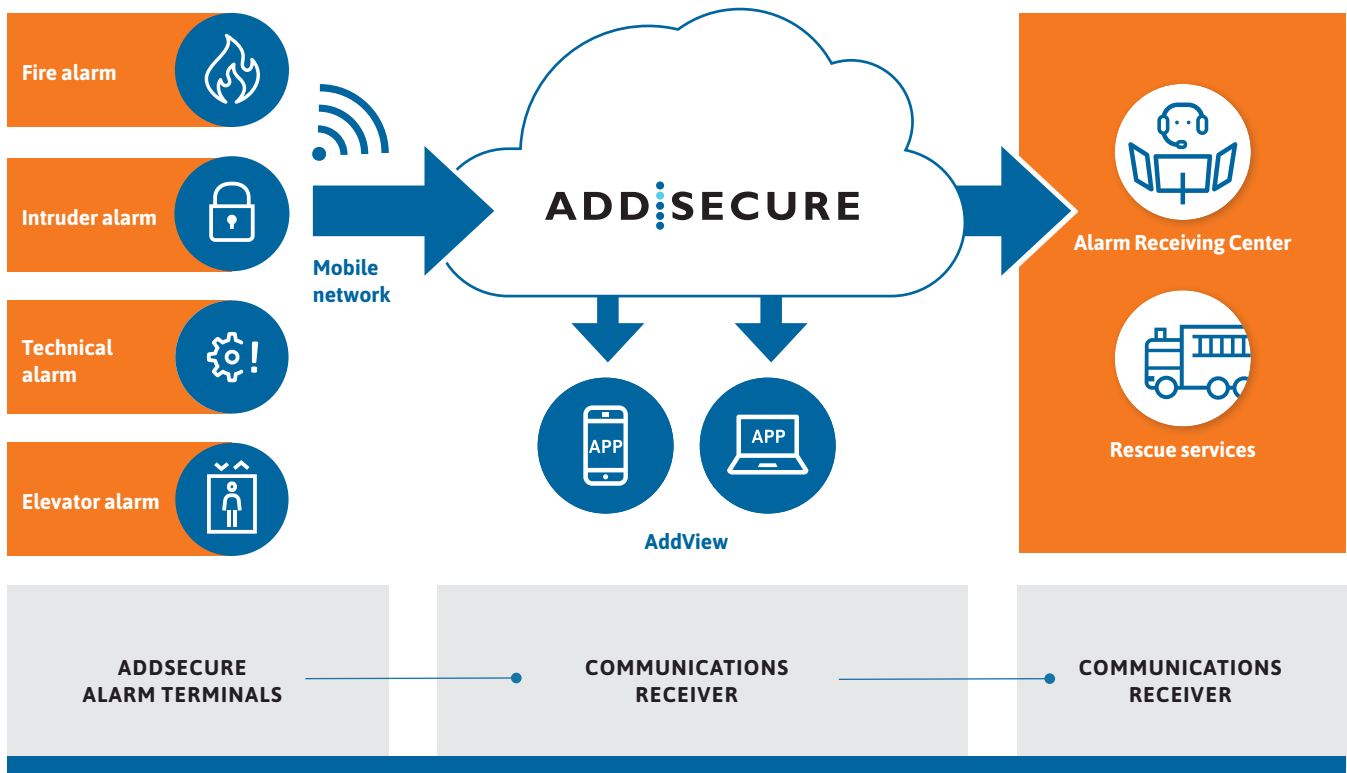

It is likely that your property has several alarms installed, such as intruder, fire and elevator alarms and maybe even several different technical alarms. Monitoring all these alarms separately both takes time and makes it difficult to get an overview. With AddView you get a quick overview and full control of all your alarm systems.

As an operations manager in municipal and state operations or for other large-scale property owners, you are often responsible for both security and maintenance of several large buildings. Requirements can be set for indoor climate, air quality and other facilities. Since there is a lot to control, it's good that there are many new smart technologies on the market that facilitate your work. Smoke detectors, alarm systems and sensors are good examples of aids used to protect life and property. But – do you really have control over whether your systems work properly?

Faults in systems and warning facilities, which are

supposed to protect people and critical functions, can have very unfortunate consequences if they are not detected and remedied in time. It is therefore important that you not only trust your technical aids but that you also have a continuous overview of your systems. With AddView, you easily gain full control of your alarm terminals.

AddSecure AddView is an internet-based service, available both via the web and as a mobile app for IOS and Android. The service is specially adapted for companies, municipalities and other organizations that are responsible for many properties. The service is used as a presentation,

management and notification system and quickly gives you an overall picture of the status, events and any deviations at your facilities. This makes it possible to quickly rectify faults in the alarm systems which secure life, property or production.

Easy to use

AddView is very user-friendly. Services do not require installation and you can easily log in via an internet browser or in the mobile app. We also see that the customers who use the service use it frequently.

Flexible

It is easy to adapt the service to your needs and you decide how your alarm messages are to be handled and by whom. For example, you can grant permissions to other people, both your own staff and service partners, at different levels. You can also easily create your own user groups for alarms and notifications. A schedule controls when group members are notified.

Easy follow-up

In addition to the ability to provide a good overview of your alarm systems in real time, AddView also logs all alarms and error messages. This makes it easy for you to follow up and

document availability time and reveal any system malfunctions.

Smart and easy overview

In AddView you can see your facilities marked on a map together with their associated operating status. In addition, there are a large number of additional smart features.

For example, you can:

- Enter your own description of the terminal's location and other important information
- Put the alarm terminal in service mode (e.g. when maintaining a terminal or system)
- View the signal strength of the alarm terminal
- Create your own alarm terminal groups for a better overview, e.g. "Elevators", "Schools", "Hospitals"
- Add relevant documents (message lists, contact details for service partners, wiring diagrams, etc.)
- Control relay outputs (switching lights on and off, opening or locking doors, etc.)

With AddView you have full control of your alarms
