Co-Driver Services

Alarm Module

Get alerted of a deviation, malfunction or a violation in real time

As a Transport Manager you need to be aware of a deviation or a malfunction related to the truck or if a violation is committed by a driver. AddSecure has developed an alarm module directly accessible in the Co-Driver Weboffice portal.
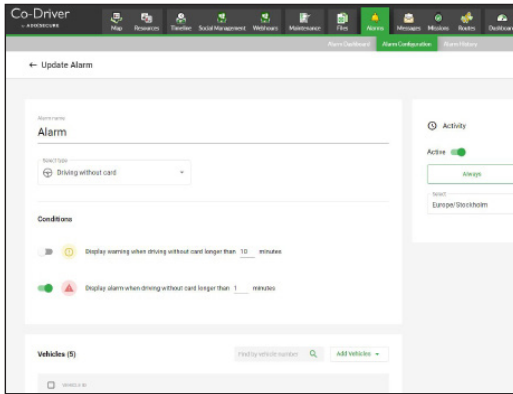

In the Dashboard you get an overview of your available alarms and how they are configured.

In Configuration you are able to configure the set up for the different alarms. And in History you see all alarms triggered by a vehicle (or group of vehicles).
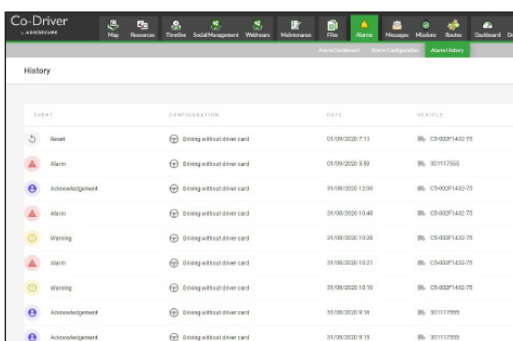

How does the alarm module work?
In this module the Transport Manager can configure different type of alarms for the different services the company is using. Each alarm can be set up for a vehicle or a group of vehicles.
The module is composed by 3 tabs:
- Dashboard
- Configuration
- History

Alarm status and states
An alarm can have 3 different statuses: active, inactive, deleted. And it can be composed by 2 states (warning, alarm). Depending on the type of alarm, the dispatcher can set up to have a warning triggered first. This warning can be related to a time interval. The warning can be seen as a reminder, and when the reminder is acknowledged, the alarm is reset to an active status if the alarm is not triggered.

Send notification in real time
When an alarm is triggered it is shown in Weboffice but the user has the possibiilty to set up automatic send of a notification by email.

Alarm for Driving without Driver Card
The legislation says that a driver always must insert a driver card in the tachograph before to start driving.
This makes it possible to download all information about driving and resting times and to make sure the drivers respect the legal working times. This alarm is triggered to alert the transport manager if a driver starts driving without a card.

Temperature Alarm*
Cold transports are well regulated and transport companies need to secure an unbroken coldchain. Our temperature alarms alert the users about deviations in real-time so that problems can be solved immediately to avoid waste of temperature sensitive goods and unnecessary costs.

Benefits
- Get informed in real-time of a deviation, malfunction and/or violation
- Prevent infraction
- Reduce fine
- Take care of deviations and malfunction early to avoid costly or more serious damages

Requirements*
- AddSecure Roadbox: an on-board computer is necessary to collect data from the tachograph
- The service related to the alarm
